

Low RMS Phase Jitter Programmable LVDS Clock Generator

Features

- Programmable LVDS clock generator
- Low RMS Phase Jitter
- Available output frequencies: 50 MHz to 700 MHz
- Package: Pb-free 8-pin thin shrunk small outline package (TSSOP)
- Supply voltage: 3.3 V or 2.5 V
- Temperature: Industrial

Functional Description

The CY2XL12 is a phase locked loop (PLL)-based high-performance clock generator that uses Cypress's low-noise voltage control oscillator (VCO) technology to achieve less than 1 ps typical RMS phase jitter. The CY2XL12 uses an external crystal reference input and drives one LVDS output pair having programmable drive strength. CY2XL12 can be programmed as Output Enable (OE), or Power Down (PD#), or Frequency Select (FS) device by configuring the pin 5. The device can be programmed either to operate at 3.3 V or at 2.5 V.

Pinouts

Figure 1. 8-pin TSSOP pinout

Pin Definitions

Pin Number	Pin Name	I/O Type	Description
1, 8	VDD	Power	3.3 V or 2.5 V power supply. All supply current flows through pin 1
2	VSS	Power	Ground
3, 4	XOUT, XIN	XTAL output and input	Parallel resonant crystal interface
5	OE / PD# / FS	CMOS input	Output enable pin: Active HIGH. If OE=1, CLK is enabled. When LOW, the output is high impedance Power-down pin: Active LOW. If PD# = 0, the device is powered down and the clock is disabled. Frequency Select pin: One of the two stored frequencies can be selected.
6, 7	CLK#, CLK	LVDS output	Differential clock output; drives one or two LVDS loads

Frequency Table

Part Number	Crystal Frequency	Output Frequency	Drive Strength	Pin 5 Function	RMS Phase Jitter (Random)	
					Offset Range	Jitter (Typical)
CY2XL12ZXI01	25 MHz	108 MHz	High	OE	637 kHz to 10 MHz	0.55 ps
CY2XL12ZXI02	25 MHz	100 MHz	High	OE	637 kHz to 10 MHz	0.53 ps
CY2XL12ZXI03	25 MHz	150 MHz	High	OE	637 kHz to 10 MHz	0.48 ps
CY2XL12ZXI06	25 MHz	50 MHz	Normal	PD#	12 kHz to 20 MHz	1.0 ps

Functional Overview

The CY2XL12 device with external crystal option has OE or PD# or FS feature of Pin 5. The OE function is used to enable or

disable CLK output. PD# function can quickly put the device in low-power state, but it takes longer time to wake-up because of reacquire of PLL lock. FS feature is used to select two different output frequencies for multirate serializer application.

Application Information

Power Supply Filtering Techniques

As in any high-speed analog circuitry, noise at the power-supply pins can degrade performance. To achieve optimum jitter performance, use good power-supply isolation practices. Figure 2 illustrates a typical filtering scheme. Because all the current flows through pin 1, the resistance and inductance between this pin and the supply is minimized. A 0.01 or 0.1 μF ceramic chip capacitor is also located close to this pin to provide a short and low-impedance AC path to ground. A 1 to 10 μF ceramic or tantalum capacitor is located in the general vicinity of this device and may be shared with other devices.

Figure 2. Power Supply Filtering

Board Layout and OE Pin

If the Output Enable (OE) function on pin 5 is not needed, it may be connected directly to the V_{DD} plane by a wide trace and multiple vias. This improves heat dissipation. A resistor between OE and V_{DD} is not necessary.

Termination for LVDS Output

The CY2XL12 is designed with programmable output drive-strength. When it is configured with High-drive, it can drive two standard LVDS loads, each one with a 100 Ω termination resistor. Figure 5 on page 5 shows the standard termination scheme. When it is programmed for Normal-drive, it can drive only one standard LVDS load (100 Ω termination resistor) as

shown in Figure 6. The termination resistors should always be located very close to the receivers, and the trace branches should be located close to the CY2XL12 output. To minimize signal reflections from the receivers, the differential impedance (Z_0) of each trace pair should be 100 Ω to match the termination resistor.

Crystal Interface

CY2XL12 should have minimum 8 pF load capacitor parallel to the resonant crystal. The capacitors C1 and C2 as shown in Figure 3 are chosen to minimize the ppm error. These optimum values of C1 and C2 can be derived based on the parasitic trace capacitance (C_p), and capacitance of the CY2XL12 device pins (XIN and XOUT). Values of C1 and C2 are layout dependant and can be calculated as $C1 = C2 = 2 \times (CL - C_p)$. When the drive level of the crystal is low and the drive level of CY2XL12 is high, the application may need an additional resistor R_{out} . When R_{out} is added, C2 is also required to be readjusted for the precise frequency calculation.

Absolute Maximum Conditions

Parameter	Description	Condition	Min	Max	Unit
V _{DD}	Supply voltage		−0.5	4.4	V
V _{IN} ^[1]	Input voltage, DC	Relative to V _{SS}	−0.5	V _{DD} + 0.5	V
T _S	Temperature, Storage	Non operating	−65	150	°C
T _J	Temperature, Junction		−	135	°C
ESD _{HBM}	Electrostatic discharge (ESD) protection (human body model)	JEDEC STD 22-A114-B	2000	−	V
UL−94	Flammability rating	At 1/8 in.	V−0		−
Θ _{JA} ^[2]	Thermal resistance, junction to ambient	0 m/s airflow	100		°C/W
		1 m/s airflow	91		
		2.5 m/s airflow	87		

Operating Conditions

Parameter	Description	Min	Max	Unit
V_{DD}	3.3 V supply voltage	3.135	3.465	V
	2.5 V supply voltage	2.375	2.625	V
T_A	Ambient temperature, industrial	−40	85	°C
T_{PU}	Power-up time for all V_{DD} to reach minimum specified voltage (ensure power ramp is monotonic)	0.05	500	ms

Notes

1. The voltage on any input or I/O pin cannot exceed the V_{DD} pins during power-up.
2. Simulated using Apache Sentinel TI software. The board is derived from the JEDEC multilayer standard. It measures 76 × 114 × 1.6 mm and has four layers of copper (2/1/1/2 oz.). The internal layers are 100% copper planes, while the top and bottom layers have 50% metallization. No vias are included in the model.

DC Electrical Characteristics

Parameter	Description	Test Conditions	Min	Typ	Max	Unit
$I_{DD}^{[3]}$	Power supply current with output terminated	$V_{DD} = 3.465\text{ V}$, $OE = V_{DD}$, output terminated	–	–	125	mA
		$V_{DD} = 2.625\text{ V}$, $OE = V_{DD}$, output terminated	–	–	120	mA
$V_{OD}^{[4]}$	LVDS differential output voltage	$V_{DD} = 3.3\text{ V}$ or 2.5 V . $R_{TERM} = 50\ \Omega$ between CLK and CLK#, High Drive Strength $R_{TERM} = 100\ \Omega$ between CLK and CLK#, Normal Drive Strength	247	–	454	mV
$\Delta V_{OD}^{[4]}$	Change in V_{OD} between complementary output states	$V_{DD} = 3.3\text{ V}$ or 2.5 V . $R_{TERM} = 50\ \Omega$ between CLK and CLK#, High Drive Strength $R_{TERM} = 100\ \Omega$ between CLK and CLK#, Normal Drive Strength	–	–	50	mV
$V_{OS}^{[5]}$	LVDS offset output voltage	$V_{DD} = 3.3\text{ V}$ or 2.5 V . $R_{TERM} = 50\ \Omega$ between CLK and CLK#, High Drive Strength $R_{TERM} = 100\ \Omega$ between CLK and CLK#, Normal Drive Strength	1.125	–	1.375	V
ΔV_{OS}	Change in V_{OS} between complementary output states	$V_{DD} = 3.3\text{ V}$ or 2.5 V . $R_{TERM} = 50\ \Omega$ between CLK and CLK#, High Drive Strength $R_{TERM} = 100\ \Omega$ between CLK and CLK#, Normal Drive Strength	–	–	50	mV
I_{OZ}	Output leakage current	Three-state output, unterminated, measured on one pin while floating the other pin, $OE = V_{SS}$	–35	–	35	μA
I_{SB}	Standby supply current.	$PD\# = V_{SS}$			200	μA
V_{IH}	Input high voltage, pin 5		$0.7 \times V_{DD}$	–	$V_{DD} + 0.3$	V
V_{IL}	Input low voltage, pin 5		–0.3	–	$0.3 \times V_{DD}$	V
I_{IH}	Input high current, pin 5	Input = V_{DD}	–	–	115	μA
I_{IL}	Input low current, pin 5	Input = V_{SS}	–50	–	–	μA
C_{IN}	Input capacitance, pin 5		–	15	–	pF
C_{INX}	Pin capacitance, XIN & XOUT		–	4.5	–	pF

Notes

- I_{DD} includes ~8 mA of current that is dissipated externally in the output termination resistor.
- Refer to [Figure 7 on page 11](#).
- Refer to [Figure 8 on page 11](#) and [Figure 9 on page 11](#).

AC Electrical Characteristics

Parameter ^[6, 7]	Description	Test Conditions	Min	Typ	Max	Unit
F_{OUT} ^[8]	Output frequency		See note 8			MHz
T_R, T_F ^[9]	Output rise or fall time	20% to 80% of full output swing	–	0.5	1.0	ns
$T_{Jitter(\phi)}$ ^[8, 10]	RMS phase jitter (Random)		See note 8			ps
T_{DC} ^[11]	Duty cycle	Measured at zero crossing point	45	–	55	%
T_{OHZ} ^[12]	Output disable time	Time from falling edge on OE to stopped outputs (asynchronous)	–	–	100	ns
T_{OE} ^[12]	Output enable time	Time from rising edge on OE to outputs at a valid frequency (asynchronous)	–	–	120	ns
T_{LOCK}	Startup time	Time for CLK to reach valid frequency measured from the time $V_{DD} = V_{DD(min)}$	–	–	5	ms

Crystal Characteristics

For SMD Package

Parameter	Description	Range 1	Range 2	Range 3	Unit
F_{IN}	Crystal frequency	8–14	14–28	28–48	MHz
R1	Maximum motional resistance (ESR)	135	50	30	Ω
CL	Parallel load capacitance (see Note 6 below)	8–18	8–14	8–12	pF
DL(max)	Maximum crystal drive level	300	300	300	μW

Notes

6. Not 100% tested, guaranteed by design and characterization.
7. Outputs are terminated with 50 Ω between CLK and CLK#. Refer to [Figure 4 on page 5](#).
8. Crystal frequency, output frequency, and typical phase jitter are listed in [Frequency Table on page 3](#).
9. Refer to [Figure 9 on page 11](#).
10. Refer to [Figure 13 on page 12](#).
11. Refer to [Figure 10 on page 11](#).
12. Refer to [Figure 11 on page 11](#).
