

ADXL700

GENERAL DESCRIPTION

The **ADXL700** device is a high precision, triaxial accelerometer designed for electronic stability control and other high performance applications. A built in temperature compensation routine ensures sensitivity stability to better than $\pm 3\%$ across the entire temperature range. The **ADXL700** is designed with selectable -3 dB filter corner frequencies to satisfy a range of applications, and the 2 kHz output data rate allows sufficient oversampling of the acceleration information.

The acceleration data output from the device is a true 16-bit word and is contained in a 32-bit SPI transaction. The SPI interface contains additional fault detection bits and data formatting bits designed to assist high reliability applications. SPI communications are compatible up to 8 MHz. The 16-bit acceleration data-word offers a resolution of 0.434 mg/LSB for the $\pm 14.2\text{ g}$ full-scale range of the device.

The **ADXL700** is available in an SOIC package with an inverted paddle for improved EMI/RFI robustness. The **ADXL700** operates at both 3.3 V and 5 V, and is specified to operate across the full automotive temperature range of -40°C to $+105^{\circ}\text{C}$.

APPLICATIONS

- Vehicle dynamic control (VDC)
- Electronic stability program (ESP)
- Electronic chassis control
- Platform stabilization/leveling
