

1:2 Differential LVPECL/LVECL/HSTL Clock and Data Drivers

MAX9320/MAX9320A

General Description

The MAX9320/MAX9320A are low-skew, 1-to-2 differential drivers designed for clock and data distribution. The input is reproduced at two differential outputs. The differential input can be adapted to accept single-ended inputs by applying an external reference voltage.

The MAX9320/MAX9320A feature ultra-low propagation delay (208ps), part-to-part skew (20ps), and output-to-output skew (6ps) with 30mA maximum supply current, making these devices ideal for clock distribution. For interfacing to differential HSTL and LVPECL signals, these devices operate over a +2.25V to +3.8V supply range, allowing high-performance clock or data distribution in systems with a nominal +2.5V or +3.3V supply. For differential LVECL operation, these devices operate from a -2.25V to -3.8V supply.

The pinout is the only difference between the MAX9320 and MAX9320A. Multiple pinouts are provided to simplify routing across a backplane to either side of a double-sided board.

These devices are offered in space-saving 8-pin SOT23, μ MAX, and SO packages.

Features

- ◆ Improved Second Source of the MC10LVEP11 (MAX9320)
- ◆ +2.25V to +3.8V Differential HSTL/LVPECL Operation
- ◆ -2.25V to -3.8V LVECL Operation
- ◆ Low 22mA (typ) Supply Current
- ◆ 20ps (typ) Part-to-Part Skew
- ◆ 6ps (typ) Output-to-Output Skew
- ◆ 208ps (typ) Propagation Delay
- ◆ Minimum 300mV Output at 3GHz
- ◆ Outputs Low for Open Input
- ◆ ESD Protection >2kV (Human Body Model)
- ◆ Available in Thermally Enhanced Exposed-Pad SO Package

Applications

Precision Clock Distribution
Low-Jitter Data Repeater
Protection Switching

ESD Protection	
Human Body Model (D, $\overline{D}$, Q ₊ , Q ₋)	>2kV
Soldering Temperature (10s)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

Pin Description (MAX9320)

PIN		NAME	FUNCTION
μ MAX/SO	SOT23		
1	8	Q0	Noninverting Q0 Output. Typically terminate with 50 Ω resistor to V _{CC} - 2V.
2	7	$\overline{Q0}$	Inverting Q0 Output. Typically terminate with 50 Ω resistor to V _{CC} - 2V.
3	6	Q1	Noninverting Q1 Output. Typically terminate with 50 Ω resistor to V _{CC} - 2V.
4	5	$\overline{Q1}$	Inverting Q1 Output. Typically terminate with 50 Ω resistor to V _{CC} - 2V.
5	2	V _{EE}	Negative Supply Voltage
6	4	$\overline{D}$	Inverting Differential Input. 60k Ω pullup to V _{CC} and 100k Ω pulldown to V _{EE} .
7	3	D	Noninverting Differential Input. 100k Ω pulldown to V _{EE} .
8	1	V _{CC}	Positive Supply Voltage. Bypass from V _{CC} to V _{EE} with 0.1 μ F and 0.01 μ F ceramic capacitors. Place the capacitors as close to the device as possible with the smaller value capacitor closest to the device.

Pin Description (MAX9320A)

PIN	NAME	FUNCTION
SOT23		
1	V _{CC}	Positive Supply Voltage. Bypass from V _{CC} to V _{EE} with 0.1 μ F and 0.01 μ F ceramic capacitors. Place the capacitors as close to the device as possible with the smaller value capacitor closest to the device.

8	Q0	Noninverting Q0 Output. Typically terminate with 50 Ω resistor to V _{CC} - 2V.

1:2 Differential LVPECL/LVECL/HSTL Clock and Data Drivers

Figure 1. Differential Transition Time and Propagation Delay Timing Diagram

Detailed Description

The MAX9320/MAX9320A low-skew, 1-to-2 differential drivers are designed for clock and data distribution. For interfacing to differential HSTL and LVPECL signals, these devices operate over a +2.25V to +3.8V supply range, allowing high-performance clock and data distribution in systems with a nominal +2.5V or +3.3V supply. For differential LVECL operation, these devices operate from a -2.25V to -3.8V supply.

Inputs

The maximum magnitude of the differential input from $\bar{D}$ to D is $V_{CC} - V_{EE}$ or 3.0V, whichever is less. This limit also applies to the difference between any reference voltage input and a single-ended input.

The differential inputs have bias resistors that drive the outputs to a differential low when the inputs are open. The inverting input, $\bar{D}$, is biased with a 60k Ω pullup to V_{CC} and a 100k Ω pulldown to V_{EE} . The noninverting input, D , is biased with a 100k Ω pulldown to V_{EE} .

Specifications for the high and low voltages of the differential input (V_{IHD} and V_{ILD}) and the differential input voltage ($V_{IHD} - V_{ILD}$) apply simultaneously (V_{ILD} cannot be higher than V_{IHD}).

Outputs

Output levels are referenced to V_{CC} and are considered LVPECL or LVECL, depending on the level of the V_{CC} supply. With V_{CC} connected to a positive supply and V_{EE} connected to GND, the outputs are LVPECL. The outputs are LVECL when V_{CC} is connected to GND and V_{EE} is connected to a negative supply.

A single-ended input of $\pm 100\text{mV}$ around a reference voltage or a differential input of at least $\pm 100\text{mV}$ switches the outputs to the V_{OH} and V_{OL} levels specified in the DC Electrical Characteristics table.

Applications Information

Supply Bypassing

Bypass V_{CC} to V_{EE} with high-frequency surface-mount ceramic 0.1 μF and 0.01 μF capacitors in parallel as close to the device as possible, with the 0.01 μF value capacitor closest to the device. Use multiple parallel vias for low inductance.

Traces

Input and output trace characteristics affect the performance of the MAX9320/MAX9320A. Connect each signal of a differential input or output to a 50 Ω characteristic impedance trace. Minimize the number of vias to prevent impedance discontinuities. Reduce reflections by maintaining the 50 Ω characteristic impedance through connectors and across cables. Reduce skew within a differential pair by matching the electrical length of the traces.

The exposed-pad (EP) SO package can be soldered to the PC board for enhanced thermal performance. If the EP is not soldered to the PC board, the thermal resistance is the same as the regular SO package. The EP is connected to the chip V_{EE} supply. Be sure that the pad does not touch signal lines or other supplies.

Contact the Maxim Packaging department for guidelines on the use of EP packages.

Output Termination

Terminate outputs through 50 Ω to $V_{CC} - 2\text{V}$ or use an equivalent Thevenin termination. Terminate both outputs and use the same termination on each for the lowest output-to-output skew. When a single-ended signal is taken from a differential output, terminate both outputs. For example, if Q_0 is used as a single-ended output, terminate both Q_0 and $\bar{Q}_0$.
