2.125Gbps/1.063Gbps, 3.3V Fibre Channel Repeater

General Description

The MAX3770 is a 2.125Gbps Fibre Channel repeater IC. The MAX3771 provides a pin-compatible solution for 1.063Gbps Fibre Channel. Both devices are optimized for use in Fibre Channel arbitrated-loop applications and operate from a 3.3V supply.

The MAX3770 is compatible with Fibre Channel jitter tolerance requirements and can recover data signals with up to 0.7 unit interval (UI) jitter. The circuit's fully integrated phase-locked loop (PLL) provides a frequency lock indication and does not need an external reference clock.

The MAX3770 provides low-jitter CML clock and data outputs. To reduce the external parts count, all signal inputs and outputs are internally terminated. The MAX3770/MAX3771 are available in 16-pin QSOP packages.

Applications

2.125Gbps Fibre Channel Storage Area Networks
1.063Gbps Fibre Channel Fibre Channel Hubs
Fibre Channel Storage Systems

Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
MAX3770CEE	0°C to +70°C	16 QSOP
MAX3771CEE*	0°C to +70°C	16 QSOP

*Future product—contact factory for availability.

Features

- ◆ Meet Fibre Channel Jitter Tolerance Requirements
- ◆ 3.0V to 3.6V Operation
- ◆ Internally Terminated Data and Clock I/O
- ◆ Reference Clock Not Required
- ◆ Frequency Lock Indication
- ◆ Low Power Consumption
 - 215mW at 3.3V (MAX3770)
 - 190mW at 3.3V (MAX3771)

Pin Configuration

MAX3770/MAX3771

2.125Gbps/1.063Gbps, 3.3V Fibre Channel Repeaters

ABSOLUTE MAXIMUM RATINGS

Supply Voltage, V_{CC}-0.5V to +5.0V
 Pin Voltage Levels (IN+, IN-, FILT+, FILT-,
 LOCKEN, CLKEN, LOCK)-0.5V to ($V_{CC} + 0.5V$)
 LOCK Output Current-1mA to +10mA
 CML Output Currents OUT+, OUT-,
 CLK+, CLK-.....-22mA to +22mA

Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)
 16-Pin TQFP (derate 6.7mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$).....533mW
 Operating Temperature Range..... 0°C to $+70^\circ\text{C}$
 Storage Temperature Range..... -55°C to $+150^\circ\text{C}$
 Processing Temperature (die)..... $+400^\circ\text{C}$
 Lead Temperature (soldering, 10s)..... $+300^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

($V_{CC} = +3.0V$ to $+3.6V$, $T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$, unless otherwise noted. Typical values are at $T_A = +25^\circ\text{C}$.)

PARAMETER	CONDITIONS		MIN	TYP	MAX	UNITS
Supply Current (Note 1)	CLKEN = V_{CC}	MAX3771		63		mA
		MAX3770		81	112	
	CLKEN = GND	MAX3771		57		
		MAX3770		67.5	91	
Differential Voltage Signal at OUT or CLOCK	$R_{LOAD} = 150\Omega$, Figure 1		400	780	1000	mVp-p
Output Current at OUT or CLOCK	Sum of I_{OUT+} and I_{OUT-}			10.5		mA
LOCK Output Low	$I_{OL} = +1\text{mA}$				0.7	V
LOCK Output High	$I_{OH} = -100\mu\text{A}$		2.4			V
Differential Input Voltage Swing			200		2200	mVp-p
Input Common-Mode Voltage				$V_{CC} - 0.45$		V
Voltage at FILT+, FILT-				$V_{CC} - 1.03$		V
CLOCKEN and LOCKEN Input Current			-5		+5	μA
Differential Input Resistance			132	150	181	Ω
Differential Output Resistance	OUT+, OUT-, CLK+, CLK-		132	150	181	Ω

Note 1: Supply current includes output currents.

Note 7: Jitter tolerance measurements at 85kHz and 1270kHz are limited by test equipment. Actual jitter tolerance > indicated.

2.125Gbps/1.063Gbps, 3.3V Fibre Channel Repeaters

Pin Description

PIN	NAME	FUNCTION
1	FILT+	PLL Loop Filter Connection. Connect a 0.22 μ F capacitor between FILT+ and FILT-.
2	FILT-	PLL Loop Filter Connection. Connect a 0.22 μ F capacitor between FILT+ and FILT-.
3, 6, 12	GND	Ground
4	IN+	Positive CML Data Input (Figure 3)
5	IN-	Negative CML Data Input (Figure 3)
7, 8	V _{CC}	Supply Voltage
9	LOCKEN	When this input is forced high, the lock indicator is enabled. Ground for normal operation.
10	OUT-	Negative 75 Ω CML Data Output (Figure 4)
11	OUT+	Positive 75 Ω CML Data Output (Figure 4)
13	CLKEN	When this input is forced high, the clock output is enabled. Ground for normal operation.
14	CLK-	Negative 75 Ω CML Clock Output (Figure 4). Enabled when CLKEN is forced high; disabled when CLKEN is forced low.
15	CLK+	Positive 75 Ω CML Clock Output (Figure 4). Enabled when CLKEN is forced high; disabled when CLKEN is forced low.
16	LOCK	Frequency Lock Indicator. High level indicates the PLL is frequency-locked. Disabled when LOCKEN is forced low. The output of the LOCK pin may chatter when large jitter is applied to the input.

Typical Operating Characteristics

Figure 1. Example of Output Signal with $R_{LOAD} = 150\Omega$

Figure 2. Functional Diagram

2.125Gbps/1.063Gbps, 3.3V Fibre Channel Repeaters

Detailed Description

Figure 2 shows the functional diagram of the MAX3770 Fibre Channel repeater IC. The MAX3770 consists of a fully integrated phased-lock loop (PLL), CML input and output buffers, and a data latch. The PLL consists of a phase/frequency detector (PFD), a loop filter, and a voltage-controlled oscillator (VCO). The input and output signal buffers employ low-noise CML architecture and are terminated on-chip.

Phase and Frequency Detector

The phase/frequency detector generates an output signal that reflects the phase relationship between the incoming data and the internal clock generated by the VCO. Data recovery is accomplished by feedback in the PLL, which drives the error voltage to zero, aligning the falling edge of the recovered clock to the center of the data eye.

The phase frequency detector generates a frequency lock indication that can be monitored at the LOCK pin (Table 1). When the PLL is frequency-locked onto the incoming data, lock transitions high.

VCO and Latch

The fully integrated VCO contains an internal current reference and filter circuitry to minimize the influence of VCC noise. The VCO is trimmed to 2.125GHz (MAX3770) and creates a clock output with frequency proportional to the control voltage applied by the loop filter. Data recovery is accomplished by using the recovered clock signal to latch the incoming data to the CML output buffers, significantly reducing the output jitter.

Applications Information

Figures 3 and 4 show models for the MAX3770/MAX3771 inputs and outputs, including package parasitics. Figure 5 shows typical 50Ω termination applications.

Design Procedure

The MAX3770's performance can be greatly affected by circuit board layout and design. Use good high-frequency design techniques, including minimizing ground inductance and using fixed-impedance transmission lines on the data and clock signals. All IN, OUT, and CLK pins can be connected with 0.1μF or 0.01μF coupling capacitors. If DC coupling is desired, pay particular attention to the DC voltage and current requirements at the pins of interest (see *DC Electrical Characteristics*). The MAX3750/MAX3751 port bypass circuit can be DC-coupled to the MAX3770/MAX3771 repeater. A 0.22μF capacitor should be used for the loop filter.

Figure 4. Output Structure

Control Functions

The lock enable (LOCKEN) and clock enable (CLKEN) pins can be configured to control the PLL's clock. Table 1 shows the operational modes available.
